
PERSONAL STATEMENT

I'm a Master's student from California State University, Los Angeles, and I would like to apply the skills I built at university from my excellent professors to my career. Besides my studies, I have spent most time designing, creating, and making personal projects as both perspectives of developers and customers to approach reality aspects. Most people complain about how they can have experiences when they are just graduated or not even graduate. We don't need to go to work to seek expertise. Experience comes from whatever we have done for our artwork. By working on my interest in Web Development through projects during university time, I'm proud to say that my experience is an absolute qualifier for this position.

As my GPA, which is 4.0, demonstrates, I'm a quick learner who is not afraid of challenging and adapting to new things. This strength keeps me continuing to grow and make differences in my career. I am eager to develop hard-technical skills as well as soft skills from experience through class projects, activities, and problem-solving. My group of friends and I were not only working on the homework assigned in classes, but we also worked through professional style interview problems from internet resources such as LeetCode and TripleByte. We did whiteboard practice, analyzed questions, and discussed ideas to come up with solutions. As a result, my professors are impressed by my performance, acknowledged my abilities, potential in the field of computer science.

As a long-term goal, I am dedicating to mastering web development in all its aspects, especially progressive Web Applications. To supplement the knowledge that I gain from lectures, I am also building websites that typically test my determination and broadens my horizons to new and emerging technologies. Having a solid fundamental background in computer science, as well as an understanding of merging technologies, is of paramount importance to my long-term goal. Although life has presented many challenges to me, I have persevered. To achieve my dreams, studying and taking graduate classes to understand the latest developments in technology will allow me to become a more qualified candidate for jobs I will have in the future. With support and resources, I hope to turn my skills into reality and make the world a better place.
